included building national data centers.

It considered the semiconductor industry a new driving force for development, and planned to invest in all three areas: design, manufacture and packaging.

In terms of automobile technologies, developing electric cars, using clean materials, low carbon emissions, and green transportation were among its priorities.

"To develop these fields, Vietnam will promote three strategic breakthroughs: strategic infrastructure, training high-quality human resources and perfecting institutions."

The breakthroughs would facilitate and reduce costs for businesses and the public.

Businesses would hopefully cooperate and invest effectively and sustainably in Vietnam, and his government would accompany and cooperate with them based on the principle of harmonizing the interests of the state, people and businesses, and would share their risks.

The company executives said Vietnam has been attracting many semiconductor players like Intel, Samsung, Amkor, Qualcomm, Infineon, Marvell, and Hana Micron.

The American Semiconductor Industry Association, the Asian Semiconductor Association and a number of corporations also appreciate Vietnam's potential in this field, they said.

Chinh said Vietnam was able to maintain economic stability, control inflation and promote growth even amid all the challenges in 2023.

It attracted nearly US\$37 billion worth of FDI, he said.

The country relies on internal resources but at the same time welcomes support and assistance from international partners, he added.
